

GRID INTEGRATION OF RENEWABLES - RESEARCH STOCKTAKE

Australia's electricity distribution industry is undergoing considerable change and significant effort has been placed on research and reform to allow renewable energy, storage and demand management into the mix.

Research institutions, government agencies, network operators and other stakeholders have all made strong contributions to the reform process.

The Clean Energy Council has produced a stocktake report designed to capture the background and objectives of these activities, while not critiquing them.

The stocktake included these important stakeholders. For more information download the full stocktake report at cleanenergycouncil.org.au/fpdi
